1 Crossdock.....1

1 Crossdock

Within CTMS there are 2 types of Cross Docks: one that is created via the **Bookings** functionality where multiple orders will be created, and the second where a single Order is cross docked via one or more locations. This item is focussing on the second type of crossdock.

An example of a crossdock is where an Order is scheduled to be delivered from A to B. A and B are 200 miles apart, there is another depot (called C) that is approximately 100 miles from each location. A decision is therefore made to move Order from A to C and to then move it from B to C (normally on a different **Trip**). This would potentially allow the first **Trip** to go and collect some additional Orders or to take an Order back from C to A.

This module's main feature is to allow the user to schedule an **Order** to be delivered via one or more locations.

The Main modules used in Cross Docks are

- **ORDERS** (Oracle Form)
- **New Order** (Oracle Form)
- **TRIPSUM** (Oracle Form)
- **TRIPPLAN** (Oracle Form)
- **PLANNING** (Oracle Form)
- TRM (Database Package)

If an Order is scheduled from its collection point to a cross dock location it will be set to a status of SCHED_COLL.
