# 1 Orders Interface

**Warning:** This is an incomplete guide.

An FTP process has been created to transfer Order information from a source system into **C-TMS**. The orders arrive in CSV files and are processed into **C-TMS** with errors being reported to a new **C-TMS** screen for manual administration by the users.

Interface Errors screen (a new tab will be added for each new interface).

Interface Id	Cost Centre	Customer	From Loc	To Loc	Sched Date	Early Avail	Late Avail	Early

Include Duplicate Order records ? ☐

Interface Validation Error

ORDER interface record CRHE\_110\_A66\_ORD00023897221060504\_1.txt is for MTS operation COFF.

Line No	Product Type	Du Type	Quantity	Qty In Cases	Weight	Cube

The Interfacing team should provide the interface data, extracting the necessary order data from the source system, constructing it into a **CSV** format consisting of a record header, order header and order detail or details lines and forward it to **C-TMS** where its arrival triggers an upload process. Each file contains exactly one order and is validated for structure on arrival to the server before invoking the appropriate **C-TMS** operation (DB) to process it.

The interface is designed to be generic. **C-TMS** reads the header to determine the interface type before channelling it for processing. The **CSV** format is extracted into interface order header and interface order details tables. Errors during this upload halt processing and result in the error being written to the tables for viewing in the **C-TMS** Interface Errors screen. If successfully extracted, the order is validated for loading into the **C-TMS** orders tables. Errors are written to the interface table for viewing and the order is rolled back. Successes are committed to the orders tables and are available for normal **C-TMS** orders / trip processing etc.

The FTP interface is one way (from an external source to **C-TMS**). Errors displayed on the error screen are administered manually via contact between **C-TMS** and external systems and will either result in data changes or a resend of a corrected FTP file. The FTP file name is used as the interface identifier (int\_record\_id) enabling order records, interface table records and files to be traced back to their origins.

## 1.1 LogiNext Details

This tab shows the interface messages and details of any messages to LogiNext systems.

Close Action

The screen will display the details of all records from the new LogiNext audit detail described above.

You can filter the search using the search criteria in the top of the tab page and clicking **Search**.

You can reprocess the currently highlighted record by pressing the **Reprocess** button, this will then invoke the reprocessing function

Only failed outbound messages will be available to be reprocessed and an error will be shown if any other type of record is selected for reprocessing.

**Note:** You will not be able to edit data in this screen any errors with trips should be rectified in the planning screen.
