EMERGENCY RELEASE - CTMS 11.0

RELNOTE ER034-016

Module	Program Name	Ver	Call/Iss	Client Ref	Pr'ty	Remarks
TIU_TRIP_STATUS.sql	Trigger	5.54	359660	WREQ0031943	3	The EDI processes for LOAD and CITD messages will need to have a new EDI parameter called OUTBASE_INDICATOR set to Y to enable the new functionality. When the parameter is Y, the LOAD and CITD messages will be split by outbase for the same TMS trip to create separate WMS loads based on the outbase indicator. Note that any orders that are not going to an outbase for a customer that is using the van fleet will not be included in a file for the outbase and these orders will be included in a file for the TMS trip itself without an outbase indicator. The customers and fixed routes will need to have the new 'Van Fleet' flag set to Y to enable the new functionality. The outbases will be identified as RDC locations that exist with an 'OUTBASE_INDICATOR' decoded value for 'REFERENCE'. This outbase indicator will be a single character to be included in the TMS trip to replace the first digit of the trip number (e.g. MAN-A0123456 instead of MAN-00123456). This decoded value must exist to enable the new functionality.
