EMERGENCY RELEASE - WMS 810

RELNOTE ER046-005

Module	Program Name	Ver	Call/Iss	Client Ref	Pr'ty	Remarks
DP_WMS_ALLOC.sql	Allocation Procedure	4.217	04065045	-	3	Pick header records were not always created when multiple orders were processed by range or route/load because if the SAPP rule is "Y" the process was checking the page number and product type but was not checking the order number. If two order lines were processed with the same page number and product type but for different order numbers it failed to trigger the creation of the pick header record. When a number of orders are allocated by order range or route/load and they contain single lines for full pallets and stock codes with the same product type a pick header record with page number 1 should be created for each order allowing them to be pick confirmed.
