Portal X-Ref

Contents

1 Portal X-Ref

This page is used to setup/maintain ?List? data which is not retrieved from other source systems. The most common use of this data is for drop-downs of data which are in the core Portal pages or on module pages where the source system does not hold the required data.

The user can select the module then the X-Ref value (these will be retrieved from the Portal system based on the Portal version in use) and then enter values/descriptions for the required data setup.

They can also edit the descriptions of existing values, set a value as a default (though this will only apply if the specific X-Ref has been coded to use a default) or delete X-Ref values.

NOTE: It is advisable NOT to change any of the values in this page

unless specifically instructed to do so by a member of the Aptean support team.
