1 FAQ

Common Queries and Questions

1.1 How to Allocate Held Stock

Set up:

The screenshot shows the 'Owner Maintenance' window for Company JP1, Department 0000, dated 02-FEB-2012. The 'Owner' field is set to 'XXA' and '001' (Standard Client (3pl)). The 'Owner Rule' tab is active, displaying a table of rules:

Rule	Description	Flag
AAEU	Auto Allocation	Y
AGPK	Automatic packing	N
AHSD	Allocate Held Stock	H
ANAT	Allow Negative Available Total	N
AREF	Display Act Advice Note No field	Y
CASB	Committed used in Stock Balances Calculation	N
CHOR	Number of days held before order is cancelled	002
CONT	Contract Number	N
CONT	Display Container Details	Y
COOR	Collection Required	Y

Ensure that the Owner Rule ?AHSD? is set with a value of ?H?. This will enable the allocation of held stock functionality to work with line type ?R? orders only.

The screenshot shows the 'Customer Wizard' window for Owner XXA, Warehouse 001, dated 02-FEB-2012. The 'SOP Details' tab is active, showing various fields for customer setup. The 'Allow Allocation of Held Stock' flag is set to 'Yes'.

Field	Value
Partner Code	S001 001
Full Name	Higgsons & Sons LTD
Currency	GBP British Pound
Credit Limit	0.00
Current Order Balance	0.00
Remaining Credit	0.00

Cancel Line

Therefore ?Min Intake Life? is $120 + 60 = 180$ Days

And the ?Issue Life? = 60 Days

Any item that is within the ?Issue Life? timeframe (i.e. in the warehouse with less than 60 days to its ?sell by date?) will not be allocated.

3. The ?Max Intake Life? can be set at any figure greater than the ?Min Intake Life? and is designed to give the stock holder some control over having outlandish ?sell by dates? which are too far in the future.

You can set these figures to whatever suits you as a warehouse operator but remember that the difference between the ?Min Intake Life? and the ?Issue Life? has to be long enough to allow you to perform all your normal warehouse operations from receipt to despatch (including allocation).

Incidentally you can always check the state of your ?sell by date? stock by running the ?Out of date Stock report? which is in the Warehouse reports menu. From the above example were you to input a date 60 days in the future it would show you what stock was in the warehouse that had gone into its ?issue Life? and therefore couldn't be allocated.

1.3 How to Create a Pick Walk Sequence

Within the WMS there is the ability to configure a specific pick walk sequence through the warehouse to help maximise picking efficiency.

WMS Set Up -

Owner Maintenance (STS1000)

Aisle Seq/ Pick Seq/ Order Line/ System Rotation/ Pallet Id

Aisle Seq/ Pick Seq/ Product Type/ Stock Code/ System Rotation/ Pallet Id

For a greater control and efficiency over the pick walk sequence select either a value of 3 or 4, so that the picking tasks will be sorted by location.

Aisle Sequence Maintenance (WHS0060)

[illegible]

NB: This will create a basic sequential count beginning at 1 for each individual aisle. It will also overwrite any existing records.

Free Locations (WHS0091)

Once the Aisle and Location code have been assigned their sequence numbers, then run Free Location Generation which will create the Aisle Pick Sequence which is used to sort the picking tasks.

1.4 Printer Setup

1.4.1 Obtaining the printer name

Obtain the printer name as held on the print server from either the system administrator or logon on to the print server and execute the 'lpstat' command to list all printers on the server.

```
v770-DEV(lbw)$ lpstat
Queue    Dev      Status   Job Files      User          PP %    Blks   Cp Rnk
-----
hp1      hp@hp    READY
hp1      hp@hp    READY
```

1.4.2 Printer configuration and Maintenance

Below are the steps required to set up a printer on the WMS system

1.4.2.1 Print Queue Maintenance (PHL3510)

Used to link printers on the print server to the WMS application

Field Name	Description	Options	Generic Value
<i>Printer Name</i>	Name of the printer as held on the server	The field is case sensitive and must match the name on the server (see below)	Defined by site
<i>Model No</i>	Model Number of the printer	Free text field	Defined by site
<i>Description</i>	Free text field	Printer name as known in the warehouse	Defined by site
<i>Printer Type</i>	As selected from the drop down list		Default - HP Laser Jet - Line Printer

1.4.2.2 Printer Groups (PHL3520)

The screen is used to group printers together, which might be by type, such as all zebra printers or possibly by area such as a warehouse or an area within a warehouse.

Field Name	Description	Options	Generic Value
<i>Printer Name</i>	Name of the printer as held on the server	The field is case sensitive and must match the name on the server (see below)	Defined by site
<i>Group Name</i>	Specifies the group name for the selected printers	20 character free text field	Defined by site

This screen allows the user to specify the device the print job is to be sent to, such as to screen or to a printer etc.

The output manger will default in the last Printer Group and Printer used, though there is the option to select an alternative if required.

The form is used to assign a default printer for specific documentation such as a report or label print to a user.

Note: Not all programs, reports and label formats are called from this screen. Below is a list of current programs which use this functionality. Aptean will advise which report and label formats can be used.

Field Name	Description	Options	Generic Value
<i>Owner</i>	Client or owner code as set-up on the system	The user will be able to select from a list of valid owner codes	Defined by site
<i>Program</i>	The calling program that will generate the report or label output	The program id is entered followed by an underscore character and the user id of the person who will require the print option.	Existing program that can call the Output Manager
<i>Description</i>	Description of the process as entered in the program field	Will default from system level information	N/a
<i>Printer</i>	The default printer the print job is to be sent to	As maintained in Printer Queue Maintenance	Defined by the client
Buttons			
SWAP Printer	Allows the user to change a printer for another one without having to change each line		

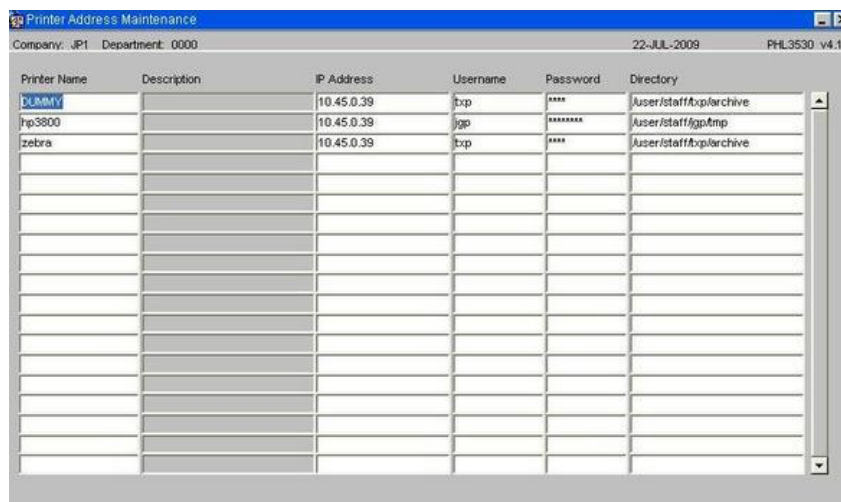

Table of existing programs that are called by the Default Printer Maintenance Screen

Calling Program	Description
WHS0150	Goods Receipt - Conf
WHS0520	Generated Pallet Movements
WHS0530	Driver Ticket Reprint
WHS0630	Stock Adjustments
WHS0700	Stock Movements
WHS0710	Generate Stock Movements
WHS0915	Pallet Enquiry
WHS1714	Pick List Confirmation
WHS1900	Despatch Print
WHS1910	Despatch by Route/Load
WHS1941	Shipment Label Print
WHS1945	Order Packing
WHS2054	Change Ownership of Stock
WHS7886	Goods Receipt Using RDT
WHR1702	Picking Label Program
WHS1700	Pick List
WHS1710	Pick List Confirmation
WHS1721	Packing List

1.4.2.5 Printer Address Maintenance (PHL3530)

Used to automatically send print jobs to an external 3rd party server for printing, this is achieved by sending a flat file directly via ftp, circumventing the need to run the job through the XF monitor process.

Field Name	Description	Options	Generic Value
Printer Name	Name of the printer as held on the server	Printer associated with a specific packing station or stations	Defined by site
I.P. Address	I.P. address of the external server		Defined by site
Username	Username of the account on the external server		Defined by site
Password	Password of the account on the server		Defined by site
Directory	Directory where the print job is to be delivered		Defined by site

1.4.2.6 Silent Printing For Packing List

Ensure the following system registry settings have been added -

DefaultAsDirectory ?/edistore?

BarCodeFontWHR1945 ?xxx?

Within **Default Printer Maintenance** add the following setting -

WHS1945_LIST_LOGON

1.5 How to Re-Send WCS Messages

You should use the WCS Message Reprocessing screen [WHS7921](#).

The screen is initially in entry mode and prompts for Queue, Status and Date. Any combination of these can be entered.

Usually the users will be interested in today's messages and only those with an EXPIRED status.

Messages can also be at status READY and PROCESSED.

The message type indicates what function the message is trying to do. For example, the 611 message is a pick confirmation and pallet move (moving the pallet from the pick face to the marshalling location). The 601 message is the Receipt update message, see below for the full list.

13

WCS Message Reprocessing

Owner: D23 Warehouse: W05 12-FEB-10 VHS7921 v4.1

Queue:
 Status:
 Date: 12-FEB-10

Queue	Status	Time queued	No. Retries	Type	Description
AQ\$_QTABL_VMSWCS_E	EXPIRED	12-FEB-2010 15:09:54	6	View Process	PALCRE
AQ\$_QTABL_VMSWCS_E	EXPIRED	12-FEB-2010 15:09:54	6		PALCRE
AQ\$_QTABL_VMSWCS_E	EXPIRED	12-FEB-2010 15:09:54	6		PALCRE

The message will only fully process if it is able - if there is a data issue the message could expire again. Where it failed originally due to record locks it should re-process as long as the lock blocking it has been released.

List of the most commonly used RF messages

- 601 - Receipt Update
- 611 - Pallet Move Update
- 621 - Pick Update
- 631 - Aisle Status Update
- 651 - Pallet Enquiry
- 671 - Stock Take Update
- 681 - Despatch Update
- 691 - Location C/D Validation
- 711 - Location Enquiry
- 721 - Owner Validation
- 751 - Pack/Shipment Update
- 999 - WMS Interface

1.6 Identifying Record Locks

You should use the **Locked Record Monitor (FXMLOCKM)**.

 **Note:** All info is shown at database level, so if there is more than one contract using the database then their info will be visible to anyone going into this screen.

First Tab Page - Record Locks

Shows any user or process (e.g. EDI or WCS) holding a record lock. The screen also shows how long they've been holding the lock, and which owners & warehouses they have access to.

If the screen shows ?UNKNOWN? for the transaction start time - this means Oracle is unable to provide it, however this is usually correct.

The third line shows that user JYR has been locking records PACK_HEADER & PACK_LEVEL) for approx 10 minutes (screen shots taken at 15:53pm).

The columns for SID, Inst & SERIAL# are for support purposes - they are not relevant to the operation.

[illegible]

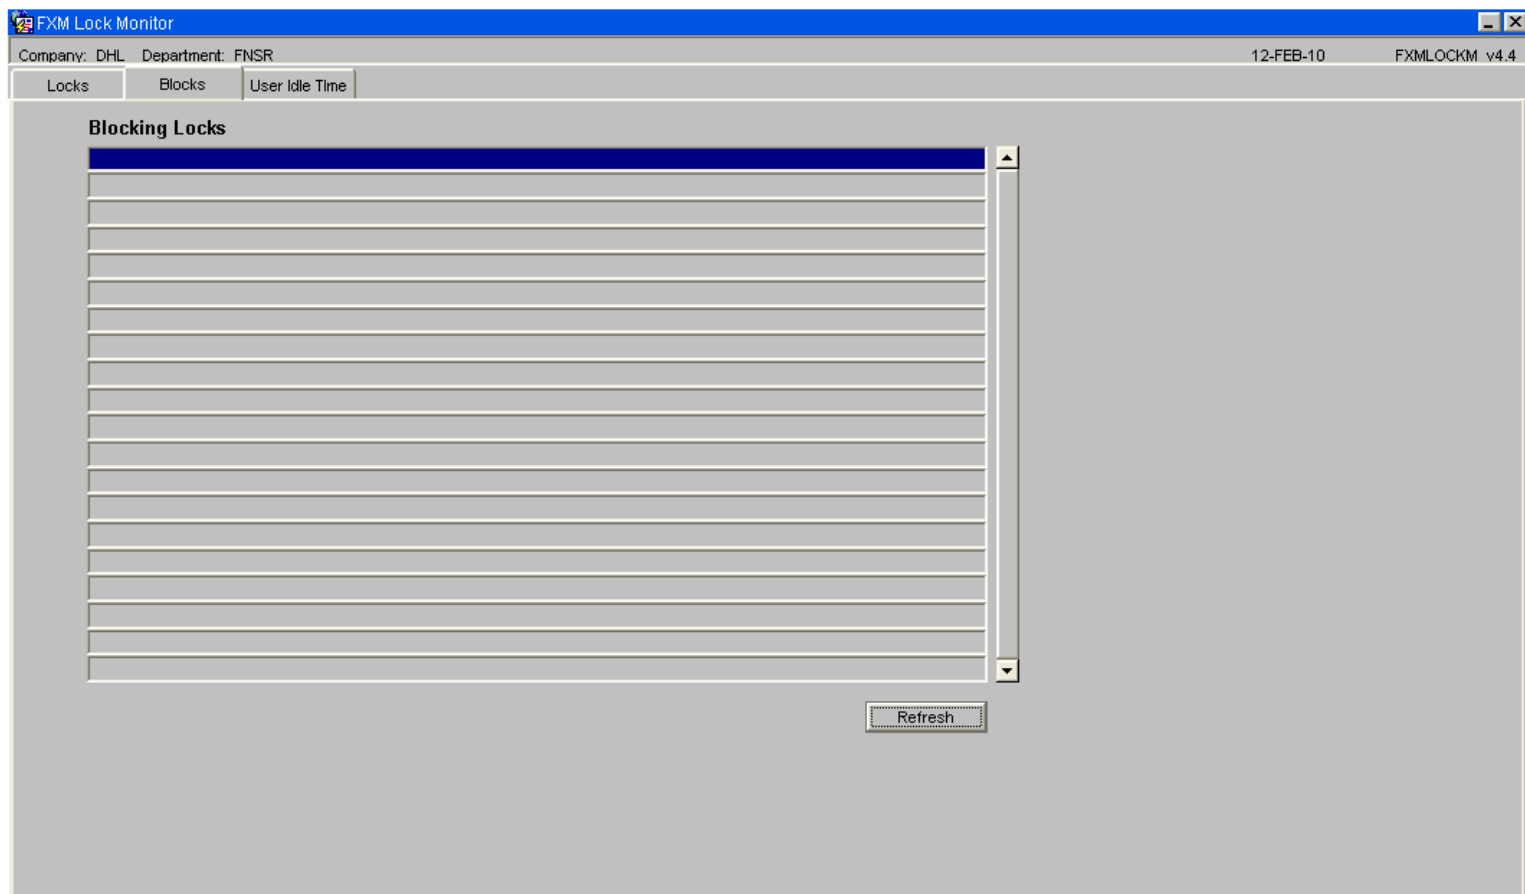

Second tab page - Blocking Locks

This is when one user is holding a lock on a record that another user also wants to update.

The user id of the person locking the record and the user id of the person being locked out are displayed and the table which is being locked.

The SID and instance are for support purposes.

Third tab page - users on system

This lists the users connected to the system. The initial sort order is by Idle Time (i.e. how long since a user issued a command to the database).

All columns on these page can be used as a sort parameter. Clicking on the heading buttons sorts ascending, then with a second click descending.

Useful columns to site are really Logon Time and Idle Time.

[illegible]

Fourth tab page - multiple sessions

The fourth tab page shows if users have multiple sessions logged in under the same username. This isn't an issue as such, but can be useful to ensure users are logged in with the correct usernames and aren't locking themselves out with multiple sessions

[illegible]

Fifth tab - Jobs Running

The fifth tab page shows any jobs that are running. There are 2 types of jobs that will be seen - EDI runs and the WMS/WCS interface.

In the screenshot below, just the WMS/WCS interface is running - there are always 5 entries for this interface. EDI type jobs will have 1 entry for each - so 1 for products, 1 for orders - but only show when the EDI is actually executing an upload. The interface to WCS is always running.
