1 SOS1428 Stock Kits Assembly Confirmation.....1

The user is able to confirm that the components have been assembled into the kit by clicking on the ?Confirm? button on this screen. This will decrease the stock levels on the pallet records for the component stock items and increase the stock levels for the kit item. However, it is possible that the original order quantities for the components has been changed or that there was a shortfall of stock. Either way, the confirm procedure must recalculate the number of kits that can be assembled from the actual components picked. This may leave an excess of components. The excess components will be moved from marshalling to the assembly location, placed on hold, and dealt with by the users manually.
