Mainly used for RF enabled warehouses, this screen determines what kind of truck can be used around the warehouse. The truck types entered here can then either be added into location types maintenance, or entered onto a handheld RDT when processing.

## **Note:**

- The Truck Type entered must be 2 characters long
- Intrinsically Safe identifies whether the truck is considered safe for use with Flammable goods stored in flammable aisles.
- The **Send** button will refresh the WCS with all truck types, their description and the intrinsically safe information.
